# Data Definition Language (DDL), Views and Indexes

**Instructor: Shel Finkelstein** 

#### Reference:

A First Course in Database Systems, 3<sup>rd</sup> edition, Chapter 2.3 and 8.1-8.4

# **Important Notices**

- Lab2 assignment is due by Sunday, Feb 5, 11:59pm on Canvas (zip file).
  - Lab2 answer will be posted on Monday, Feb 6.
- Lab3 assignment will be posted by Monday, Feb 6.
  - Due by Sunday, Feb 26, 11:59pm (3 weeks)
- Gradiance 2 was posted was posted Tuesday, Jan 31
  - Due by Friday, Feb 10, 11:59pm
- Reminder: Midterm is on Monday, Feb 13; no make-ups
  - You may bring a single two-sided 8.5" x 11" sheet of paper with as much info written (or printed) on it as you can fit and read unassisted.
    - No sharing of these sheets will be permitted.
  - For DSC accommodation, please submit forms to me well in advance.

# **HAVING Example**

SELECT e.name, SUM(m.length)

FROM MovieExec e, Movies m

WHERE m.producerC# = e.cert#

**GROUP BY e.name** 

HAVING MIN(m.year) < 1930;

Find the total film length for just those producers who made at least one film prior to 1930.

# **Another HAVING Example**

SELECT e.name, SUM(m.length), MAX(m.year)
FROM MovieExec e, Movies m
WHERE m.producerC# = e.cert#
GROUP BY e.name
HAVING COUNT(DISTINCT m.year) >=3
AND MIN(m.year) < 1930;

Find the total film length and the latest movie year, for just those producers who made movies in at least 3 different years, and made at least one film prior to 1930.

# **SQL Language**

- Data Manipulation Language (DML)
  - Access and modify data
  - SELECT, INSERT, DELETE, UPDATE
- Data Definition Language (DDL)
  - Modify structure of data
  - CREATE, DROP, ALTER
- Data Control Language (DCL)
  - Control access to the data (security)
  - GRANT, REVOKE
- Databases also have Utilities, such as Backup/Restore
  - Syntax not specified in the SQL standard

### **CREATE TABLE**

```
name CHAR(30),
address VARCHAR(255) DEFAULT 'Hollywood',
gender CHAR(1),
birthdate DATE NOT NULL DEFAULT '2001-12-30'
PRIMARY KEY (name)
);
```

- PRIMARY KEY
- DEFAULT
- NOT NULL

## **Reminder: Some Facts About Nulls**

- Almost all comparisons with NULL will evaluate to unknown. If Salary is NULL, then the following will be unknown (treated like false):
  - Salary = 10
  - Salary <> 10
  - 90 > Salary OR 90 <= Salary</p>
  - Salary = NULL
  - Salary <> NULL
- Use of IS NULL and IS NOT NULL
  - Salary IS NULL will be true if Salary is NULL, false otherwise
  - Salary IS NOT NULL will be true if Salary <u>isn't</u> NULL, false otherwise
- ORDER BY works with attributes that can have NULL values
  - NULL will probably be smallest or largest value
  - Not specified by SQL standard, so it depends on the implementation
- GROUP BY also works with attributes that can have NULL values

#### **DROP TABLE**

Dropping a table:

DROP TABLE MovieStar;

- Don't assume that rolling back transaction will bring back the table!
  - Interaction of DDL and transactions may depend on implementation.

#### **ALTER TABLE**

- Adding a column to a table:
  - ALTER TABLE MovieStar ADD phone CHAR(16) DEFAULT 'unlisted';
- Dropping a column from a table:
  - ALTER TABLE MovieStar DROP birthdate;
  - In some systems:
     ALTER TABLE MovieStar DROP COLUMN birthdate;
  - In some SQL systems, dropping a column isn't allowed.
- Changing the type of a column:
  - Some implementations let you change type of column in limited ways.

# What Can You CREATE/DROP in SQL DDL?

- TABLE
- VIEW
- INDEX
- ASSERTION
- TRIGGER
- SCHEMA
- PROCEDURE/FUNCTION/TYPE
  - SQL2003 standard, but there are significant variations in implementations in different systems

• ...

## **Views**

 Views help with logical data independence, allowing you to retrieve data as if it matched the description in the view.

```
CREATE VIEW < view-name > AS < view-definition > ;

CREATE VIEW ParamountMovies AS

SELECT title, year

FROM Movies

WHERE studioName = 'Paramount';
```

- You may now ask queries on ParamountMovies as if it were a table:
   SELECT title FROM ParamountMovies WHERE year=1976;
  - Composition in SQL is powerful: Tables, Queries, Views

#### **More Views**

```
Movies (title, year, length, genre, studioName, producerC#)
MovieExec ( name , address , cert# , netWorth )
CREATE VIEW MovieProd AS
    SELECT m.title, e.name, e.genre
    FROM Movies m, MovieExec e
    WHERE m.producerC# = e.cert#;
   SELECT DISTINCT genre
    FROM MovieProd
    WHERE name = 'George Lucas';
```

# Renaming Attributes in CREATE VIEW

```
Movies (title, year, length, genre, studioName, producerC#)
MovieExec ( name , address , cert# , netWorth )
CREATE VIEW MovieProd(movie_title, prod_name, movie_genre) AS
    SELECT m.title, e.name, e.genre
    FROM Movies m, MovieExec e
    WHERE m.producerC# = e.cert#;
   SELECT DISTINCT movie genre
    FROM MovieProd
    WHERE prod_name = 'George Lucas';
```

## What is a View?

- A view can include any SQL SELECT statement
  - Including UNION, Aggregates, GROUP BY, HAVING,
     ORDER BY, etc.
- A view is <u>not</u> stored as a table
  - The tables underlying the view are stored in the database,
     but only the description of the view is in the database
  - ... although some systems support MATERIALIZED VIEWS
- But a view can be used in many (not all) of the same ways as tables
  - Views can be queried
  - Views can be defined on views, as well as on tables!

## **Queries on Views and Tables**

```
CREATE VIEW Paramount Movies AS
    SELECT title, year
    FROM Movies
    WHERE studioName = 'Paramount';
SFLECT DISTINCT s.starName
FROM ParamountMovies p , StarsIn s
WHERE p.title = s.movieTitle AND p.year = s.movieYear;
CREATE VIEW ParamountStars AS
   SELECT DISTINCT starName
   FROM ParamountMovies, StarsIn
   WHERE title = movieTitle AND year = movieYear;
```

#### **DROP VIEW**

```
CREATE VIEW ParamountMovies AS

SELECT title , year

FROM Movies

WHERE studioName = 'Paramount';
```

DROP View ParamountMovies;

- What happens if you execute the following after dropping that view?
  - SELECT \* FROM ParamountMovies;
  - SELECT \* FROM Movies;

## **View Updates**

- Some modification operations on views work, but others do not, generally failing either because:
  - Constraint on underlying table would be violated, or
  - The effects of the View modification is not well-defined on the underlying tables.
- This is a complex topic, which we'll only discuss briefly.
  - See book, section 8.2 for more info.

# **View Update Problems**

Movies(title, year, length, genre, studioName, producerC#)

**CREATE VIEW ParamountMovies AS** 

SELECT title, year

**FROM Movies** 

WHERE studioName = 'Paramount';

INSERT INTO ParamountMovies VALUES ('StarTrek', 1979);

The INSERT will fail if the other columns of Movies (besides title and year) don't have defaults, and also don't allow NULL values.

# **View Update Problems (continued)**

Ambiguous View Update example with Employees and Departments

<< We'll draw this on the board >>

## **Motivation for Indexes**

Searching an entire table may take a long time:

```
SELECT *
FROM Movies
WHERE studioName = 'Disney' AND year = 1990;
```

If there were 100 Million movies, searching them might take a while. An index (e.g., a B-Tree) would allow faster access to matching movies.

If a table is updated, all Indexes on that table are immediately <u>automatically</u> updated within the same transaction.

- Which indexes do you need to change on INSERT and DELETE?
- What about UPDATE?

#### **CREATE INDEX**

```
SFI FCT *
FROM Movies
WHERE studioName = 'Disney' AND year = 1990;
How much would each of these indexes help?
   CREATE INDEX YearIndex ON Movies(year);
   CREATE INDEX StudioIndex ON Movies(studioName);
   CREATE INDEX YSIndex ON Movies(year, studioName);
   CREATE INDEX SYIndex ON Movies(studioName, year);
```

How much would each of the indexes help if the WHERE clause was just year = 1990?

# **Indexes and Ordering**

```
SELECT *
FROM Movies
WHERE studioName = 'Disney' AND year < 1990;
How much would each of these indexes help?
   CREATE INDEX YearIndex ON Movies(year);
   CREATE INDEX StudioIndex ON Movies(studioName);
   CREATE INDEX YSIndex ON Movies(year, studioName);
   CREATE INDEX SYIndex ON Movies(studioName, year);
```

How much would each of the indexes help if the WHERE clause was just year < 1990?

# **Disadvantages of Indexes?**

- Why not put indexes on every attributes, or even on every combination of attributes you might query on?
  - Huge number of indexes
  - Space for indexes
  - Cache impact of searching indexes
  - Update time for indexes when table is modified

# **Index Design**

- Most Database Administrators (DBAs) pick a set of indexes that work well on expected workload, and there are tools that help pick good indexes
  - But workloads change, so choice of indexes may need to change
    - DROP INDEX YearIndex;
- Keys are indexed (automatically in many database systems) to:
  - Help maintain uniqueness (primary key, unique)
  - Check Foreign Key references to Primary Keys (Referential Integrity)

## **Index Utilization**

- SQL statements don't have to be modified to specify use of indexes.
  - Database Optimizer tries to figure out "best"/good way to execute SQL query.
  - Tables can be scanned entirely, as well as accessed via indexes.
  - Some systems have ways that you can tell the optimizer what to do. This has advantages and disadvantages.
     (What are they?)
- Many SQL systems (including PostgreSQL) have an EXPLAIN PLAN statement, so that you can see what plan the optimizer chooses for a SQL statement.
